## **The Photo Filter Module** The Photo Filter module offers a collection of filters that you can apply to a selected layer in an image or to the entire image. At the left end of the Photo Filter tab, you will find an entry for Photo Filter that has a variety of filter samples that you can apply. Clicking and scrolling through these samples will present the filters to apply to an image. Let's explore the Photo Filter's list of samples, which are organized alphabetically by Filter and Filter preset, as shown in Figure 2-3. The Filters on a Layer (P) panel icon provides access to these samples.

**Figure 2-3:** Use the Filter preset or create your own images with Photofiltre's set of filter samples. Photoshop includes a number of filter samples. Some of these filters are for retouching images and others are made for creative compositions. You can also create your own filter presets for specific image types. The Filters on a Layer (P) panel icon is the fastest way to access these filter presets. Click on the menu button, and the panel will scroll through the available filter samples, as shown in Figure 2-4. **Figure 2-4:** Photofiltre's Filter preset menu (P) panel icon provides access to a variety of filter samples. At the very top of the filter lists, you will see the Image Type icon. If you click on this icon, the top list of filters will change to include preset filters made just for that type of image. Select the Filter Type menu to see some of the available presets.

The Brush Tool You can do many things with the Brush Tool (T). In this chapter, I'll show you how to change brush size, apply a different brush, apply a gradient to a brush, change color, and make your brush selection transparent. Zooming in on an image It's pretty straightforward to zoom in on an image. First, press Ctrl+ (Apple-plus) to zoom in on an image. You can zoom in more if you want to see an area more closely. To zoom out again, press Ctrl+-.

Change Size Brushes have a fixed size. It's difficult to change their size when working with them. That's why you use a Layer Mask. To change a brush's size, press the S key on the keyboard to open the Brush window. Then move the left handle (marked with a blue dot) to change brush size. Each increase in size enlarges the brush. Notice that the Brush Settings window shows these changes. To reduce brush size, use the minus key (-). When you zoom in on an image, you may notice that the brush size changes. When you zoom out, the brush size goes back to its previous setting.

Applying a Custom Brush You can apply a custom brush to an image. Choose Layer/Artistic/Create Custom Brush from the menu, as shown here. The Brush Settings window opens: The window contains a settings bar and a preview button. The window also includes the following settings: Fill - The opacity of the brush. - The opacity of the brush. Size - The size of the brush. - The size of the brush. Shape - The shape of the brush (triangle, ellipse, elliptical, or rounded rectangle). - The shape of the brush (triangle, ellipse, elliptical, or rounded rectangle). Tool Tip - The position of the tooltip. - The position of the tooltip. Brush Color - A color. If you click the Color palette button on the Brush Settings window, you see a gradient: You can change the color of this gradient by clicking on a color box and changing it. You can also click on a text box to change the color of it. Here's an example of a filled brush with a gradient applied: You can change the gradient by clicking on the gradient box in the window. For more complex grad

## What's New in the Adobe Photoshop Free Download For Windows 10 64 Bit Filehippo?

Q: Multiple variable name definition scope I'm using the term "variable name scope" broadly. The purpose is to allow global variables, but only on the second and following use. It does not have to do with autofocus, as in "variable names not defined within this function scope".. This variable name scope cannot be applied to the creation of a global that can have a different scope than the function. For example: `var foo = 'bar'; function bar() { var bar = 'baz'; this.bar = 'bar'; this.baz = 'baz'; } bar.foo = 'foo'; alert(foo);` If I do: `console.log(bar.foo);` I am expecting to get 'foo'. I am actually getting undefined. I can test it with: `this.foo = 'foo'; alert(bar.foo); console.log(bar.foo);` Using: I can see that the first `console.log()` statement is being executed, but the second one fails. The FAQ at MDN: Says that the variable name can be applied to subsequent functions. I would have thought it would allow on the subsequent second (and following second use) of a function. If there is a different term for this, I am happy to learn it. If the global scope is equivalent to function scope within a function, the scope of this would be modified if I defined a variable using `var` in the global scope. Would it be correct to say that if I have the following: `var foo = 'bar'; function bar() { var bar = 'baz'; this.bar = 'bar'; this.baz = 'baz'; }` Then `foo` is 'bar', `bar` is 'baz', and this is bound to the function `bar` itself. A: There are two common usage patterns of variable name scopes. In one pattern, we want each function to get its own
